

IN THE CLAIMS:

1 1. (Original) A method for providing end-to-end source route information to source and
2 destination end stations coupled to respective local and remote source-route bridge (SRB)
3 subnetworks of a data link switching (DLSw) network, the local and remote SRB sub-
4 networks including respective local and remote DLSw peer devices that communicate
5 over an intermediate wide area network (WAN), the method comprising the steps of:
6 extracting the source route information from a routing information field (RIF) of a
7 first token ring (TR) explorer frame at the local DLSw device;
8 loading the source route information into a first control vector at the local DLSw
9 device;
10 transporting the first control vector over the WAN to the remote DLSw device;
11 extracting the source route information from the first control vector at the remote
12 DLSw device;
13 loading the extracted source route information into a RIF of a second TR explorer
14 frame; and
15 transmitting the second TR explorer frame over the remote SRB subnetwork to
16 the destination end station such that, upon receiving the second TR explorer frame, the
17 destination end station has complete source route information representative of an end-to-
18 end session with the source end station.

1 2. (Original) The method of Claim 1 further comprising the steps of:
2 generating the first TR explorer frame at the source end station; and
3 accumulating source route information representative of a local SRB subnetwork
4 path between the source end station and the local DLSw device within the RIF of the first

5 TR explorer frame issued by the source end station and received by the local DLSw de-
6 vice.

1 3. (Original) The method of Claim 2 further comprising the step of generating the first
2 control vector at the local DLSw device.

1 4. (Original) The method of Claim 3 wherein the step of transporting further comprises
2 the steps of:

3 appending the first control vector to a switch-to-switch protocol (SSP) header
4 message and;

5 transporting the SSP header message, including the appended first control vector,
6 over the WAN to the remote DLSw device.

1 5. (Original) The method of Claim 4 further comprising the step of generating the second
2 TR explorer frame at the remote DLSw device.

1 6. (Original) The method of Claim 5 further comprising the step of, at the remote DLSw
2 device, appending next-hop information to the source route information contained within
3 the RIF of the second TR explorer frame.

1 7. (Original) The method of Claim 6 further comprising the steps of:
2 transmitting a first response final frame containing the complete source route in-
3 formation from the destination end station to the remote DLSw device;
4 extracting the complete source route information from the first response final
5 frame at the remote DLSw device;
6 loading the complete source route information into a second control vector at the
7 remote DLSw device;
8 transporting the second control vector over the WAN to the remote DLSw device;
9 retrieving the complete source route information from the second control vector at
10 the local DLSw device;
11 loading the retrieved complete source route information into a second response fi-
12 nal frame at the local DLSw device; and
13 transmitting the second response final frame over the local SRB subnetwork to the
14 source end station such that, upon receiving the second response final frame, the source
15 end station has complete source route information representative of an end-to-end session
16 with the destination end station.

1 8. (Original) Apparatus for providing end-to-end source route information to source and
2 destination end stations coupled to respective local and remote source-route bridge (SRB)
3 subnetworks of a data link switching (DLSw) network, the local and remote SRB sub-
4 networks including respective local and remote DLSw peer devices that communicate
5 over an intermediate wide area Newark (WAN), the apparatus comprising:
6 means for extracting the source route information from a routing information field
7 (RIF) of a first token ring (TR) explorer frame at the local DLSw device;
8 means for loading the source route information into a first control vector at the lo-
9 cal DLSw device;

10 means for transporting the first control vector over the WAN to the remote DLSw
11 device;

12 means for extracting the source route information from the first control vector at
13 the remote DLSw device;

14 means for loading the extracted source route information into a RIF of a second
15 TR explorer frame; and

16 means for transmitting the second TR explorer frame over the remote SRB sub-
17 network to the destination end station such that, upon receiving the second TR explorer
18 frame, the destination end station has complete source route information representative of
19 an end-to-end session with the source end station.

1 9. (Cancelled)

1 10. (Previously Presented) Apparatus for providing end-to-end source route information to
2 source and destination end stations coupled to respective local and remote source-route
3 bridge (SRB) subnetworks of a data link switching (DLSw) network, the local and remote
4 SRB subnetworks including respective local and remote DLSw peer devices that communi-
5 cate over an intermediate wide area network (WAN) in accordance with DLSw routing in-
6 formation field (RIF) passthru functionality, the apparatus comprising:

7 a memory for storing a plurality of capability message data structures exchanged
8 among the DLSw peer devices to determine whether the peer devices support DLSw RIF
9 passthru functionality, wherein a first of the plurality of message data structures comprises a
10 DLSw RIF passthru exchange vector that indicates whether the DLSw peer devices support
11 DLSw RIF passthru functionality;

12 a processor coupled to the memory and configured to process the message data
13 structures; and

14 a network adapter coupled to the processor and memory for transmitting and receiv-
15 ing the message data structures to and from the WAN.

1 11. (Original) The apparatus of Claim 10 wherein a second of the plurality of message
2 data structures comprises a DLSw virtual ring vector that indicates a virtual ring used by
3 the DLSw peer devices.

1 12. (Original) The apparatus of Claim 11 wherein a third of the plurality of message data
2 structures comprises a DLSw local rings vector that specifies a list of local rings attached
3 to the DLSw peer devices.

1 13. (Original) The apparatus of Claim 12 further comprising a local database table cou-
2 pled to each DLSw peer device for storing information about the locally-attached rings
3 specified by the DLSw local rings vector.

1 14. (Original) The apparatus of Claim 13 further comprising a switch-to-switch protocol
2 (SSP) control vector appended to a SSP header message structure stored in the memory,
3 the SSP control vector containing source route information representative of one of the
4 SRB subnetwork paths between one of the end stations and one of the DLSw peer de-
5 vices.

1 15. (Original) The apparatus of Claim 14 wherein the SSP control vector comprises a
2 length field having contents that specify a length of the control vector and an identifica-
3 tion field having contents that specify an SSP_RIF type of control vector.

1 16. (Original) The apparatus of Claim 15 wherein the SSP control vector further com-
2 prises a source route information field containing the source route information.

1 17. (Original) The apparatus of Claim 16 further comprising a DLX info frame structure
2 stored in the memory, the DLX info frame configured to transport an appended frame
3 over the WAN after the source route information is available to the end stations on the
4 SRB subnetworks.

1 18. (Original) The apparatus of Claim 17 wherein the DLX info frame comprises a
2 header containing information required for an end-to-end RIF passthru session.

1 19. (Original) The apparatus of Claim 18 wherein the header of the DLX info frame
2 comprises a version number field containing a version number of the frame, a message

3 type field having contents that identify the DLX info frame, and a message length field
4 having contents that reflect an entire length of the frame including the header and ap-
5 pended frame.

C1
1 20. (Original) The apparatus of Claim 19 wherein the header of the DLX info frame further
2 comprises a field containing a next hop ring number and a field containing a next hop bridge
3 number.

1 21. (Currently Amended) A method for operating a router, comprising:

2 exchanging capabilities exchange messages with a remote router to inform said re-
3 mote router that said router supports RIF passthrough capability;

4 receiving, in response to said remote router learning that said router supports RIF
5 passthrough capability, a first control vector from said remote router, said first control vector
6 having source route information from a routing information field (RIF) of a first token ring
7 (TR) explorer frame transmitted by a source end station on a first TR network, said first con-
8 trol vector created at [a] said remote router connected to said first TR network;

9 extracting said source route information from said first control vector;

10 loading said extracted source route information into a RIF of a second TR explorer
11 frame; and

12 transmitting said second TR explorer frame on a second TR network to a destination
13 end station to provide said destination end station with complete source route information
14 representative of an end-to-end session with said source end station

15

16 [determining if a remote router supports RIF passthrough capability, and if said re-
17 mote router supports RIF passthrough capability, loading said source route information into a
18 message to be sent to said remote router; and
19 sending said message to said remote router so that said remote router can extract said source
20 route information and load it into a RIF of a second TR explorer frame for transmission as a
21 second TR explorer frame on a second TR network].
22

23 22. (Previously presented) The method of claim 21 further comprising: said router and said
24 remote router are DLSw devices.

25 23. (Currently Amended) A router, comprising:

26 means for exchanging capabilities exchange messages with a remote router to inform
27 said remote router that said router supports RIF passthrough capability;

28 means for receiving, in response to said remote router learning that said router sup-
29 ports RIF passthrough capability, a first control vector from said remote router, said first
30 control vector having source route information from a routing information field (RIF) of a
31 first token ring (TR) explorer frame transmitted by a source end station on a first TR net-
32 work, said first control vector created at [a] said remote router connected to said first TR
33 network;

34 means for extracting said source route information from said first control vector;

35 means for loading said extracted source route information into a RIF of a second TR
36 explorer frame; and

37 means for transmitting said second TR explorer frame on a second TR network to a
38 destination end station to provide said destination end station with complete source route in-
39 formation representative of an end-to-end session with said source end station

16

17 [means for determining if a remote router supports RIF passthrough capability, and if
18 said remote router supports RIF passthrough capability, loading said source route information
19 into a message to be sent to said remote router; and

20 means for sending said message to said remote router so that said remote router can
21 extract said source route information and load it into a RIF of a second TR explorer frame for
22 transmission as a second TR explorer frame on a second TR network].

1 24. (Currently Amended) A router, comprising:

2 a network adapter to exchange capabilities exchange messages with a remote router to
3 inform said remote router that said router supports RIF passthrough capability and, in re-
4 sponse to said remote router learning that said router supports RIF passthrough capability,
5 said router to receive a first control vector, said first control vector having source route in-
6 formation from a routing information field (RIF) of a first token ring (TR) explorer frame
7 transmitted by a source end station on a first TR network, said first control vector created at
8 said [a] remote router connected to said first TR network;

9 a processor to extract said source route information from said first control vector and
10 to load said extracted source route information into a RIF of a second TR explorer frame; and

11 a network adapter to transmit said second TR explorer frame on a second TR network
12 to a destination end station to provide said destination end station with complete source route
13 information representative of an end-to-end session with said source end station

14

15

16 [, and to determine if a remote router supports RIF passthrough capability, and if said
17 remote router supports RIF passthrough capability, loading said source route information into
18 a message to be sent to said remote router; and
19 a network adapter to transmit said message to said remote router so that said remote router
20 can extract said source route information and load it into a RIF of a second TR explorer
21 frame for transmission as a second TR explorer frame on a second TR network].

13 extracting the source route information from the first control vector at the remote
14 DLSw device;
15 loading the extracted source route information into a RIF of a second TR explorer
16 frame; and
17 transmitting the second TR explorer frame over the remote SRB subnetwork to
18 the destination end station such that, upon receiving the second TR explorer frame, the
19 destination end station has complete source route information representative of an end-to-
20 end session with the source end station.

27. (Previously Presented) Electromagnetic signals propagating on a computer network,
said electromagnetic signals carrying instructions for execution on a processor for the
practice of the method of providing end-to-end source route information to source and
destination end stations coupled to respective local and remote source-route bridge (SRB)
subnetworks of a data link switching (DLSw) network, the local and remote SRB sub-
networks including respective local and remote DLSw peer devices that communicate
over an intermediate wide area network (WAN), the method comprising the steps of:
extracting the source route information from a routing information field (RIF) of a
first token ring (TR) explorer frame at the local DLSw device;
loading the source route information into a first control vector at the local DLSw
device;
transporting the first control vector over the WAN to the remote DLSw device;
extracting the source route information from the first control vector at the remote
DLSw device;
loading the extracted source route information into a RIF of a second TR explorer
frame; and

17 transmitting the second TR explorer frame over the remote SRB subnetwork to
18 the destination end station such that, upon receiving the second TR explorer frame, the
19 destination end station has complete source route information representative of an end-to-
20 end session with the source end station.

c/ 28. (Currently Amended) A computer readable media, said computer readable media
2 containing instructions for execution in a processor for the practice of a method of oper-
3 ating a router, comprising:

4 exchanging capabilities exchange messages with a remote router to inform said
5 remote router that said router supports RIF passthrough capability;

6 receiving, in response to said remote router learning that said router supports RIF
7 passthrough capability, a first control vector from said remote router, said first control
8 vector having source route information from a routing information field (RIF) of a first
9 token ring (TR) explorer frame transmitted by a source end station on a first TR network,
10 said first control vector created at [a] said remote router connected to said first TR net-
11 work;

12 extracting said source route information from said first control vector;

13 loading said extracted source route information into a RIF of a second TR ex-
14 plorer frame; and

15 transmitting said second TR explorer frame on a second TR network to a destina-
16 tion end station to provide said destination end station with complete source route infor-
17 mation representative of an end-to-end session with said source end station
18

19 [determining if a remote router supports RIF passthrough capability, and if said
20 remote router supports RIF passthrough capability, loading said source route information
21 into a message to be sent to said remote router; and
22 sending said message to said remote router so that said remote router can extract said
23 source route information and load it into a RIF of a second TR explorer frame for trans-
24 mission as a second TR explorer frame on a second TR network].

29. (Currently Amended) Electromagnetic signals propagating on a computer network,
said electromagnetic signals carrying instructions for execution on a processor for the
practice of a method of operating a router, comprising:

exchanging capabilities exchange messages with a remote router to inform said
remote router that said router supports RIF passthrough capability;

receiving, in response to said remote router learning that said router supports RIF
passthrough capability, a first control vector from said remote router, said first control
vector having source route information from a routing information field (RIF) of a first
token ring (TR) explorer frame transmitted by a source end station on a first TR network,
said first control vector created at [a] said remote router connected to said first TR net-
work;

extracting said source route information from said first control vector;

loading said extracted source route information into a RIF of a second TR ex-
plorer frame; and

transmitting said second TR explorer frame on a second TR network to a destina-
tion end station to provide said destination end station with complete source route infor-
mation representative of an end-to-end session with said source end station

18

19 [determining if a remote router supports RIF passthrough capability, and if said
20 remote router supports RIF passthrough capability, loading said source route information
21 into a message to be sent to said remote router; and
22 sending said message to said remote router so that said remote router can extract said
23 source route information and load it into a RIF of a second TR explorer frame for trans-
24 mission as a second TR explorer frame on a second TR network].
